Demo Game test

As a Game Developer candidate, you need to successfully develop a demo game.

Test Goal - By creating demo game you will show technical knowledge, design, development and problem - solving skills, but also speed, performance, motivation and independence. Apart from showing your skills, you will also get the taste of what kind of games we are creating. You will also get better understanding of what your job will be and if this position is right for you.

Demo Game:

- Candidate needs to independently develop simple slot game demo
- Demo Game should be in playable state with solid performance and have next features:
 - Selecting bet value component
 - **Choosing Bet from list** - combo box (be creative, anything that you think will fit best for game and will show your dev. skills)
 - Reels component (5x3 - or configurable)
 - **Start spinning, spinning, stop spinning**
 - Speed up, slow down, bounce (free look and feel)
 - Showing results (after reels are stopped on new reel picture, **some win symbols should be animated**, highlighted, win value shown... free look and feel)
 - Result data (stop reel picture positions, winning lines, prize info) ideally come in form of a JSON, mimicking response from server. You should have your "server" logic separated from the game in a separate class/module, fetched by some simple API call (i.e. `mockedServer.getResponseData()` that returns result in form of a JSON)

Test will be considered successful if all items marked with **green color** are done and game can be played with no console errors. Everything additional provides opportunity for you to stand up from other candidates.

IMPORTANT NOTES:

- **Focus yourself on code organization and structure** rather than on visual representation
- **Don't use existing slot templates that can be found on the Internet.** Idea is to organize and develop project yourself. Comment on your code. **AI** assistance is permitted if it is used appropriately and does not replace genuine personal effort.

Guides and Tips:

- Technology: JavaScript, Typescript, Canvas (PixiJS), WebGL
- Any additional JS libraries can be used (ThreeJS...)
- Developers who successfully pass the test will be called for interview. Test Game will be analyzed and discussed with candidates, where we expect explanation of how features are implemented, and why
- You can use any graphics (find online) with goal that your demo looks and feels like slot game and can be played. Graphics look and feel will not be judged/scored.
